PROFILE SUMMARY

Results-driven Data Analyst fresher with cross-domain analytics experience across EV, healthcare, retail, and telecom — processing 60,000+ records, reducing reporting time by 60%, and delivering predictive models that directly inform business strategy. Proficient in SQL, Python, Power BI, Tableau, and Excel, with a proven ability to translate raw datasets into KPI dashboards, self-service reports, and actionable recommendations for stakeholders. Oracle-certified in Analytics Cloud and Database Services (2025). Backed by 4 GitHub-published projects spanning descriptive analytics, root cause analysis, and machine learning — each demonstrating the full DA workflow from data pipeline design to executive insight delivery. Targeting Data Analyst roles at product-focused MNCs and IT organisations.

TECHNICAL SKILLS

Programming & Querying: Python (Pandas, NumPy, Matplotlib, Seaborn, Scikit-learn), SQL (Joins, Subqueries, Correlated Subqueries, Aggregate Functions, Window Functions)

Data Visualization & BI: Tableau, Power BI (Data Modelling, DAX, Power Query), Advanced Excel (Pivot Tables, VLOOKUP, XLOOKUP, Power Query, Dynamic Charts)

Data Engineering: MySQL, ETL Pipeline Design, Data Cleaning, Data Validation, Schema Validation, Data Governance, Data Pipeline Design, Git, GitHub

Analytics Concepts: EDA, Descriptive Analytics, Predictive Analytics, Statistical Analysis, KPI Reporting, Trend Analysis, Variance Analysis, Root Cause Analysis, Dashboard Development, Business Intelligence, Data Storytelling, Ad-hoc Analysis, Self-Service Reporting, Process Improvement

Business Analysis: Requirements Gathering, Gap Analysis, Stakeholder Reporting, As-Is / To-Be Analysis, Data-Driven Recommendations, Cross-Functional Collaboration

Soft Skills: Analytical Thinking, Problem Solving, Attention to Detail, Stakeholder Communication, Team Collaboration

WORK EXPERIENCE

Data Analyst Intern

Oct 2025 – Mar 2026

AICTE & APSCHE – SmartInternz (SmartBridge)

GitHub Repository: github.com/Vishnu-Sai-bit/Visualization-Tool-for-Electric-Vehicle-Charge-and-Range-Analysis

- Delivered end-to-end EV charging data analysis — from raw ingestion to executive dashboard deployment — across a **240-hour, AICTE-recognised** Data Analytics internship with SmartBridge / APSCHE.
- Independently designed and executed a full EDA pipeline on **30,000+ EV charging records** — encompassing schema profiling, missing value treatment, duplicate resolution, and statistical pattern detection — surfacing battery efficiency degradation trends and cutting manual reporting effort by **40%** vs prior Excel-based workflows.
- Owned end-to-end data quality for a 30,000-record production dataset — designing validation and reconciliation workflows that resolved **1,200+ inconsistencies** across null values, duplicate records, and schema mismatches, raising verified accuracy to **>95%** before downstream analysis and dashboard delivery.
- Designed **3 interactive Tableau dashboards** tracking 8+ KPIs — enabling self-service reporting that reduced stakeholder insight extraction time by **60%** against prior manual reporting methods.
- Surfaced that charging efficiency declined by **~18% during peak utilisation windows** vs off-peak periods — a cross-variable finding incorporated as a primary KPI segmentation dimension in the final stakeholder report and dashboard.

Tools: Tableau, Excel, Python, SQL, Git, GitHub

PROJECTS

Customer Churn Analysis & Prediction Dashboard | Power BI • SQL • Python

GitHub Repository: github.com/Vishnu-Sai-bit/Customer-Churn-Analysis-and-Prediction

- Tasked with identifying why a telecom provider was losing customers — analyzed **6,418 records**, isolated **1,732 churned customers (27% overall churn rate)**, and segmented churn drivers by contract type, demographics, service usage, and customer tenure.
- Translated stakeholder reporting requirements into an interactive Power BI dashboard (Power Query, DAX, data modelling) — consolidating churn KPIs into a single executive-ready self-service reporting view.
- Authored SQL queries for **customer segmentation and churn cohort monitoring** — converting business requirements directly into structured KPI reports from source data without intermediate manual steps.
- Extended analysis into predictive analytics — trained a **Random Forest classification model in Python (82% accuracy, validated on hold-out test set)** to score all 6,418 customers by churn probability, enabling proactive targeting of highest-risk retention segments.
- Surfaced that Month-to-Month contracts carried a **46.5% churn rate** — 72% above the 27% dataset average — and identified **customer tenure under 12 months** as a secondary churn predictor, directly shaping a two-tier targeted retention strategy recommendation.

Pizza Sales Analysis Dashboard | Excel

GitHub Repository: github.com/Vishnu-Sai-bit/Pizza-Sales-Analysis

- Analyzed **21,000+ orders** across **\$817K in revenue** — identified the top 3 product categories driving 62% of total sales and quantified revenue contribution by SKU, size, and category.
- Built a multi-tab Excel KPI dashboard (Pivot Tables, slicers, dynamic charts) consolidating **6 sales metrics** into a single executive-ready view with drill-down by category, size, and time period.
- Identified peak demand windows (Fri–Sat, 6–9 PM) and top-performing SKUs — recommended reallocation of **30%+ of promotional spend** to high-conversion time slots, projected to lift weekend revenue by **15–20%**.

Hospital Emergency Room Analysis Dashboard | Power BI • MySQL

GitHub Repository: github.com/Vishnu-Sai-bit/Emergency-Room

- Built an interactive Power BI dashboard on **9,200+ patient records** — enabling real-time operational drill-down by department, shift, and patient demographic for hospital administrators.
- Converted 7 operational business questions into **SQL queries** (multi-table joins, correlated subqueries, window functions, aggregations) — independently revealing that average ER wait times exceeded **35 minutes** during peak shifts, powering the complete Power BI KPI reporting layer.
- Pinpointed **3 departments driving 70% of peak-hour bottlenecks** through root cause analysis of wait times, referral rates, and demographic distributions — enabling targeted rather than system-wide intervention.
- Delivered shift-level scheduling recommendations that, based on demand and bottleneck analysis, indicated a potential **20% reduction in average patient wait time** through optimised staff allocation — accepted by the project supervisor as the primary operational recommendation.
